F02 / CURRENCY AND SCHEDULES

Check mappings, bridges and FX gain or loss

Post Transaction / Generate · Reports / General Ledger

Follow the original currency and the LAK reporting effect through the same event.

01 **Use the matching mapping**

On a foreign operating expense, debit the foreign expense mapping and credit the paying fund. Recognize the actual LAK expense and its configured LAK offset. For income, follow the configured revenue mapping in the opposite direction.

02 **Separate conversions and settlements**

Identify the foreign quantity received or released, recognition or settlement rate, and book rate. Trace exchange bridges across both currencies. Allow for FX on the payable or receivable as well as on the cash used.

03 **Classify the difference**

A supported change between carrying value and settlement value goes to 5419 Foreign Exchange Gain / Loss. A documented decimal or payment rounding amount uses the appropriate rounding treatment. A missing rate or balancing leg requires investigation.

04 **Review special cases**

Same-currency transfers between funds may move carrying value. Foreign monetary accounts may require an approved period-end revaluation. Keep realized settlement and period-end revaluation schedules distinct from historical prepaid costs.

LAK settlement example

A USD 100 payable carries at LAK 2,200,000. It is settled from a LAK bank account for 2,230,000. Debit payable carrying value 2,200,000 and FX loss 30,000. Credit bank 2,230,000. The generator may express these amounts through currency bridges.

Before you finish

Verify original-currency balance, LAK result and bridge clearance. A zero overall journal difference alone cannot establish the correct gain or loss.
